

Portfolio Project

NFL Analysis

I've had this fairly unhealthy fascination with building and visualizing networks, aka graph analysis. I've done several mini-projects over the years but my NFL analysis project is the one that keeps me coming back. The goal was to build an interactive environment to show frequency of passes between the quarterback and receiver per team. This would be in a web-based 3D virtual reality environment. This started with [pypi.org](https://pypi.org/project/nfl-data-py/) library called nfl-data-py. I built a SQLite database to organize the data then I moved it into PostgreSQL database in AWS. Due to costs, I had to shut this down and move the project back to my local environment. The ultimate goal was to connect it to a Django framework and build out the front with WebXR, Three.js and D3.js. I did manage to format the data to use with Gephi network analysis tool to create some visuals (link below) and created a preliminary set up in Tableau.

Over the years I've visualized networks using Python, R Programming, D3.js, and even in Tableau (link below). I've been studying/working with Neo4j databases (a graph database) off and on with plans to get certified.
